

Backend Task

Overview

The aim of this task is to create a Laravel application that will get data from an API source, store it, allow for manipulation and display it to the frontend.

API Source

<https://icanhazdadjoke.com/>

Requirements

- Collect data from the API above.
- Store the responses.
- Display those responses in the frontend of the application.
- Allow the user to perform CRUD on the data which is being stored.
- Add some authentication so that the user needs to be logged in to manipulate the data.

Bonus Points

Add any additional features you think would be good than demonstrate your PHP / Laravel knowledge
